

AI Usage DISCLOSURE FORM

1. Team Details

Team Name: **Vibe Coders**

Project / Product Name: **OneClick - Smart Guided Troubleshooting Engine (Samsung PRISM GenAI Hackathon, Theme 2)**

Organization / Institution (if any): **SRM Institute of Science and Technology (SRMIST)**

Submission Date: **29 September 2026**

2. AI Usage Declaration

Did your team use any Artificial Intelligence (AI) in developing this project? **Yes**

AI assistants helped us design, code, test and document the project, and the product itself runs open-weight LLMs as one stage of its pipeline. Every AI output was reviewed, tested and edited by the team.

3. Purpose of AI Usage (Brief Details)

Idea generation / brainstorming: **Claude (Anthropic) to discuss architecture options (cache design, deeplink search, evaluation plan). The final design was decided by the team against the Theme 2 brief.**

Code generation or assistance: **Claude Code (Anthropic) as a pair-programming assistant for the Python/FastAPI engine, tests and scripts. Every change was reviewed, tested (pytest, CI gates) and merged through pull requests by the team.**

UI / UX design: **Claude (Opus) to build the Next.js storyboard website from reference screenshots; layout, content and fixes were iterated by the team.**

Content creation: **Claude to draft documentation (README, architecture notes, knowledge base) and the demo video script; edited and fact-checked against the code and measurements by the team.**

Data analysis: **Claude Code to help write evaluation scripts; Gemini 3.5 Flash-Lite as an independent LLM judge for step accuracy. All metrics come from our own evaluation code and are reported in docs/metrics.md.**

Testing / debugging: **Claude Code to help write unit tests, run the gate replica and debug failures; the website was also tested manually by the team.**

4. Feature Origin Classification

Feature 1

1. Feature Name: **Structure extraction (select mode)**
2. Self-Generated/AI-Generated/Both: **Both**
3. Description (include AI tools/platform Used, prompt used, Output Summary, Modification): Tools: Ministral 14B raced against 8B via the Mistral API at runtime; Claude Code while coding. Prompt: versioned prompt extract.v3 asks the model to list, for each fix, the ids of the article's own sentences, under a strict JSON schema. Output: sentence ids per action. Modification: our code turns ids into steps, repairs selections by rule and never lets the model write step text.

Feature 2

1. Feature Name: **Grounding (citation check)**
2. Self-Generated/AI-Generated/Both: **Both**
3. Description (include AI tools/platform Used, prompt used, Output Summary, Modification): Tools: bge-small embeddings (fastembed, local); Claude Code while coding. Prompt: implement step-level grounding from our design, with tests. Output: a step survives only if it matches its cited sentence in meaning and shares a real word with it. Modification: thresholds tuned by the team on the kit.

Feature 3

1. Feature Name: **Deeplink mapping (Screen Graph resolver)**
2. Self-Generated/AI-Generated/Both: **Both**
3. Description (include AI tools/platform Used, prompt used, Output Summary, Modification): Tools: Claude Code while coding; no LLM at runtime. Prompts such as: add a guard so the page fallback stays on the step's own settings path, with tests. Output: BM25 + dense search over the catalog descriptions, fused, then a Screen Graph and verb polarity pick the exact entry (catalog link, placeholder or manual). Modification: designed and tuned by the team on 123 hand-labelled steps (relevance 1.84/2, right screen first try 90.8%).

Feature 4

1. Feature Name: **Two-tier semantic cache**
2. Self-Generated/AI-Generated/Both: **Both**
3. Description (include AI tools/platform Used, prompt used, Output Summary, Modification): Tools: Claude Code while coding; Ministral 8B writes 8-10 rewordings in the background at runtime. Output: exact key plus meaning-based lookup over each plan's rewordings, guarded by what broke and by the article. Modification: team design and thresholds; measured 90% hit rate on 200 unseen rewordings, 1.7% wrong-plan hits.

Feature 5

1. Feature Name: **Plan compiler, schema validation and URL scrub**
2. Self-Generated/AI-Generated/Both: **Both**
3. Description (include AI tools/platform Used, prompt used, Output Summary, Modification): Tools: Claude Code while coding; no LLM at runtime. Output: the official schema fields built by rule (goal, title, 'It will' descriptions, categories, critical steps last), validated against schema.py, URLs scrubbed. Modification: rules written from the brief by the team; 100% schema-valid, 0 URL leaks.

Feature 6

1. Feature Name: **Evaluation suite (gate replica, ablation, load test, LLM judge)**
2. Self-Generated/AI-Generated/Both: **Both**
3. Description (include AI tools/platform Used, prompt used, Output Summary, Modification): Tools: Claude Code while coding; Gemini 3.5 Flash-Lite as judge (rubric prompt judge.v3). Output: the numbers in docs/metrics.md. Modification: test sets and gold labels made by the team.

5. Ethical & Compliance Confirmation

AI usage complies with guidelines and policies. **Yes**

No proprietary or copyrighted data misused. **I Agree**

6. Declaration & Sign-Off

Name of Team Representative: **Vishaal Pillay**

Role: **Team Lead**

Signature: Vishaal pillay

Date: **29 September 2026**
